

The three pull-up resistors (lmd, 0603 package) should be of values between:
6.7k (faster rise times, supports higher speeds, less prone to signal integrity problems, consumes slightly more power)
and 10k (slower, more prone to signal integrity problems, consumes less power)

To ensure the power supply to the ESP32 chip during power-up, it is advised to add an RC delay circuit at the EN pin

Condensatori di filtro da mettere all'ingresso dell'alimentazione 3.3V

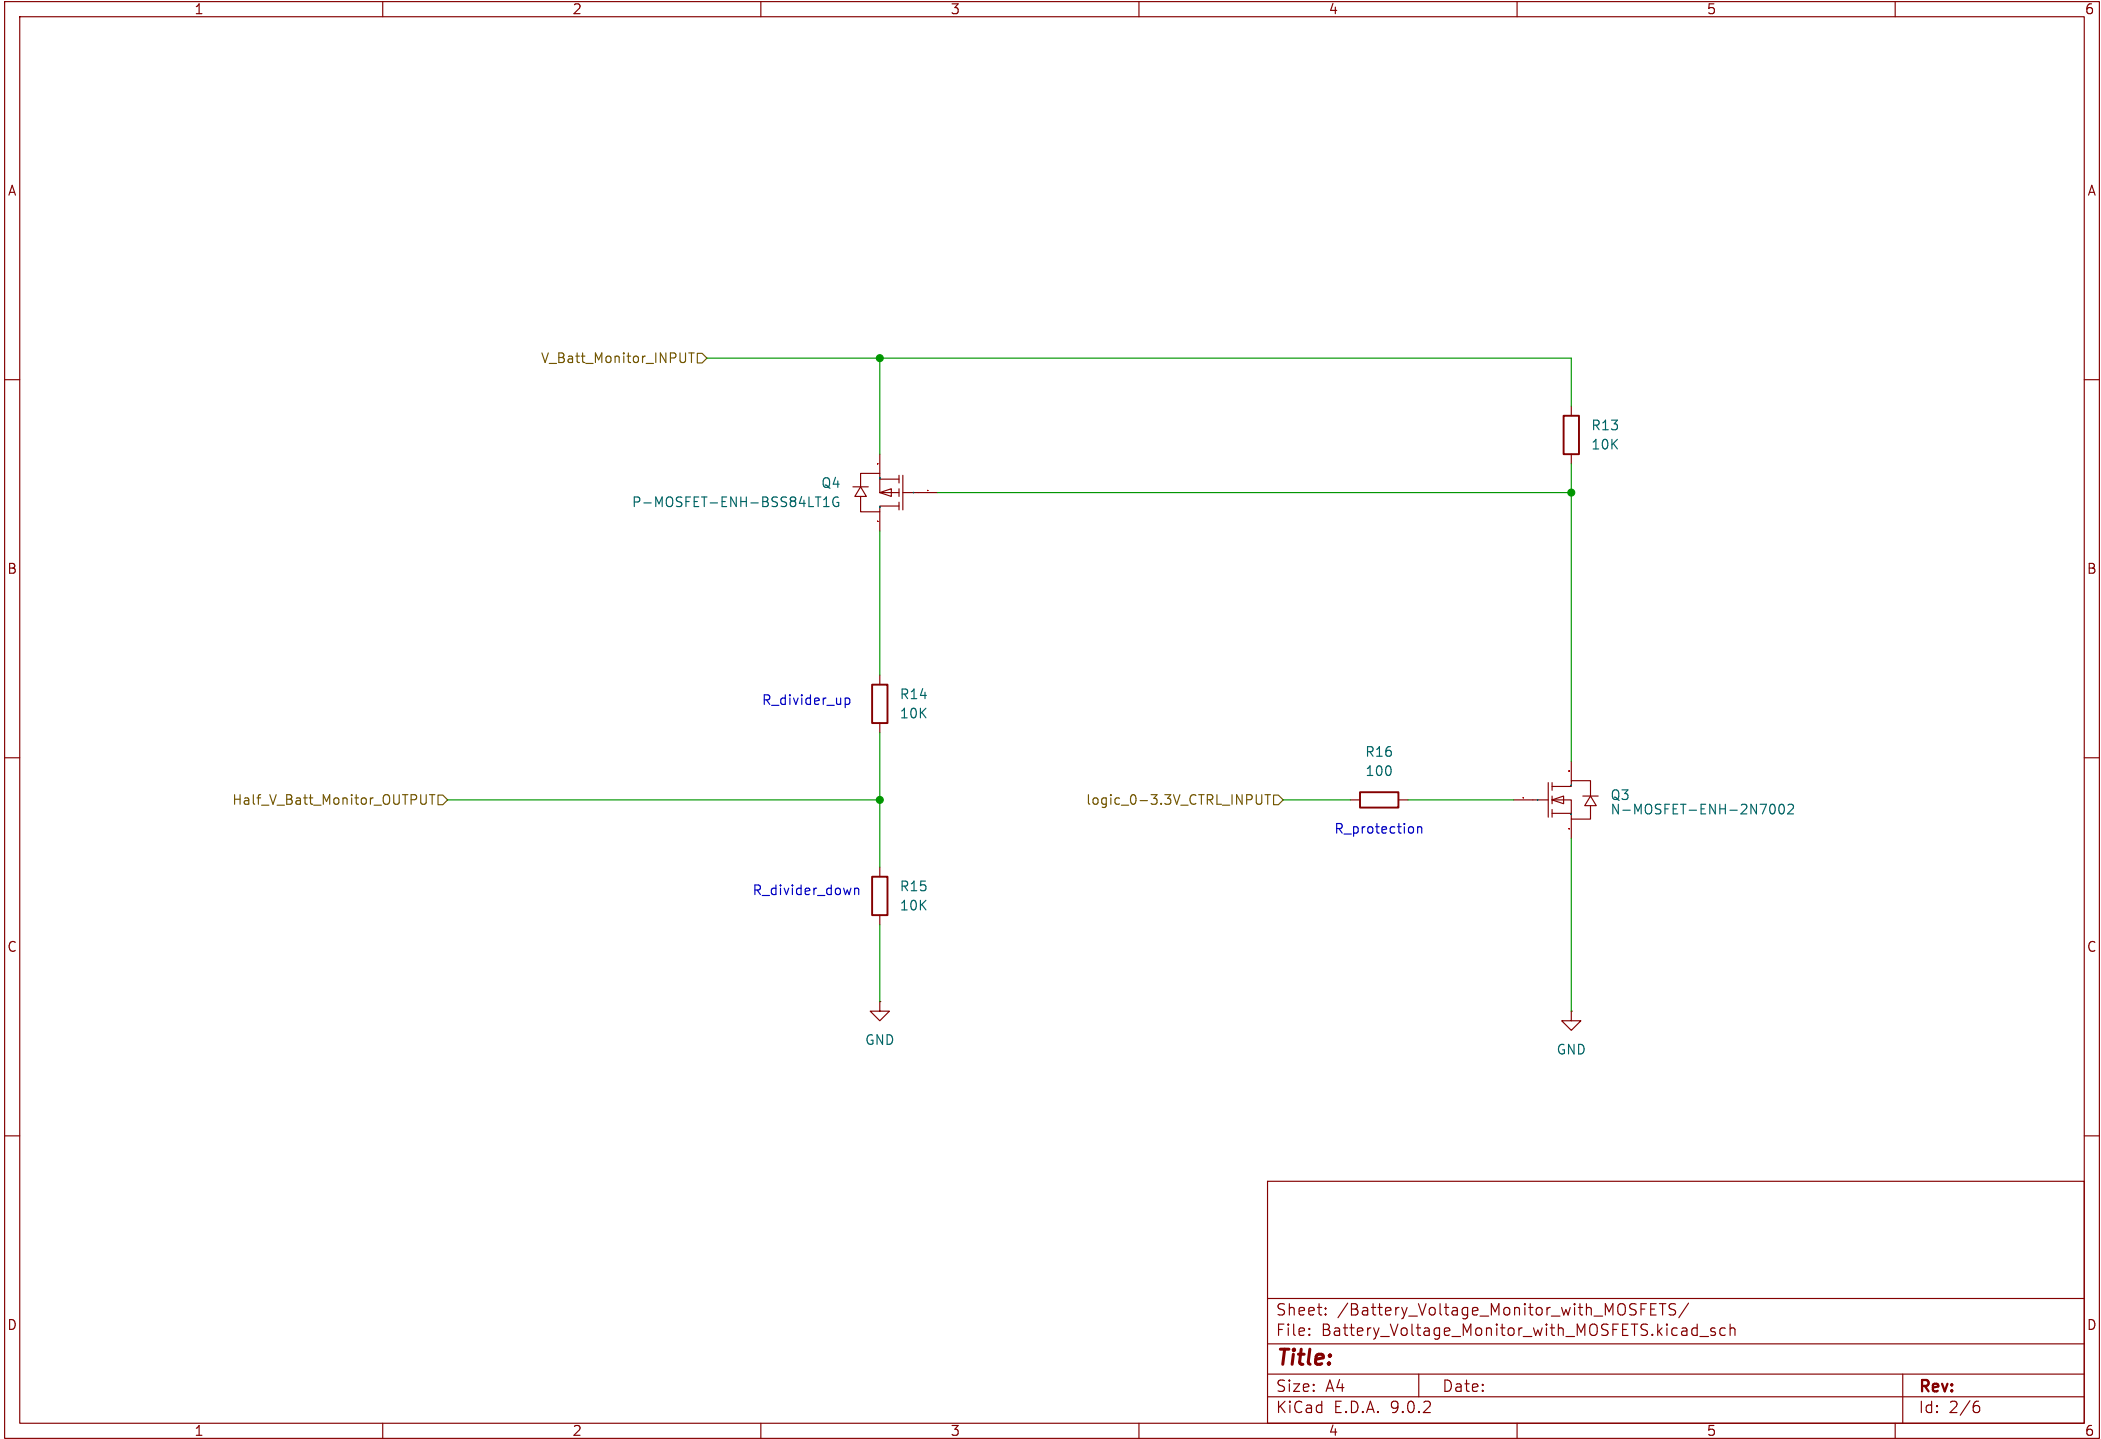

Decoupling and ceramic capacitor 0603 package (it should stay as near as possible to 3V3 when designed)

SPDT(Single Pole Double Throw)
When the battery is connected to the circuit, then it:
-the switch is toggled towards 1 --> 2 shorts with 1 (connection to circuit)--> the circuit can be powered by the battery.
-the switch is toggled towards 3 --> 2 shorts with 3 (floating) --> the circuit cannot be powered by the battery.

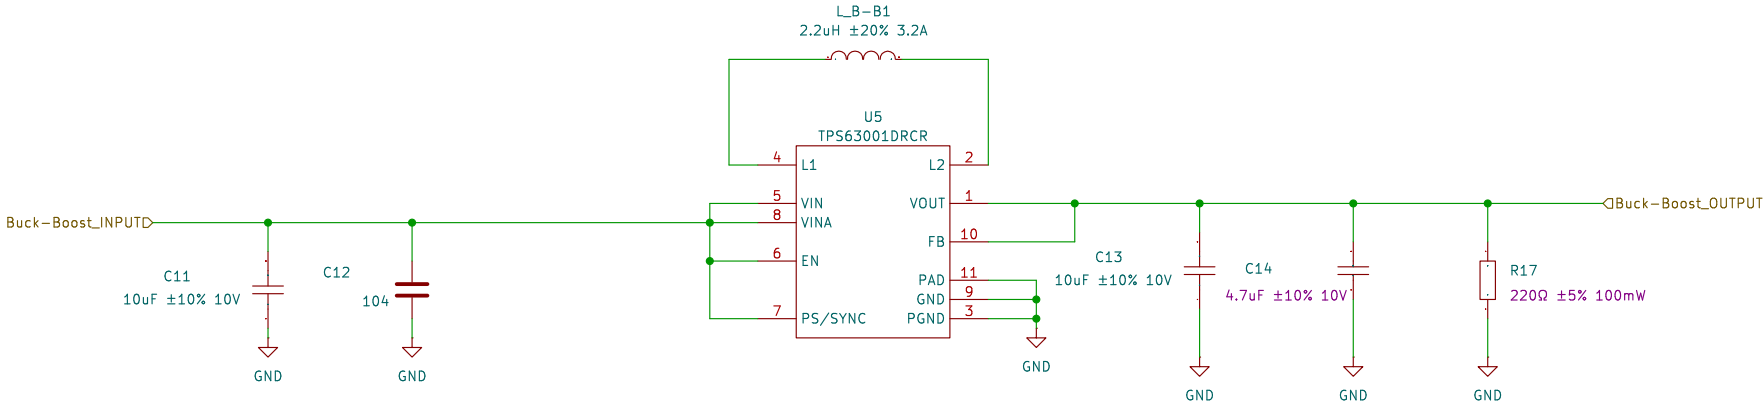

Analog to Digital Converter (ADC)
The ESP32 has 18 x 12 bits ADC input channels (while the ESP8266 only has 1x 10 bits ADC).
These are the GPIOs that can be used as ADC and respective channels:
ADC1_CH0 (GPIO 36), ADC1_CH1 (GPIO 37), ADC1_CH2 (GPIO 38), ADC1_CH3 (GPIO 39),
ADC1_CH4 (GPIO 32), ADC1_CH5 (GPIO 33), ADC1_CH6 (GPIO 34), ADC1_CH7 (GPIO 35),
ADC2_CH0 (GPIO 4), ADC2_CH1 (GPIO 5), ADC2_CH2 (GPIO 6), ADC2_CH3 (GPIO 13),
ADC2_CH4 (GPIO 15), ADC2_CH5 (GPIO 12), ADC2_CH6 (GPIO 14), ADC2_CH7 (GPIO 27),
ADC2_CH8 (GPIO 25).
Note: ADC2 pins cannot be used when Wi-Fi is used.
So, if you're using Wi-Fi and you're having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead. That should solve your problem.
The ESP32 ADC pins don't have a linear behavior.
You'll probably won't be able to distinguish between 0 and 0.1V, or between 3.2 and 3.3V.
You need to keep that in mind when using the ADC pins.
It is better to scale the input signal to the ADC to Voltages to a range [0.7V; 1.9V].

Input only pins
GPIOs 34 to 39 are GPIOs - input only pins.
These pins don't have internal pull-up or pull-down resistors.
They can't be used as outputs, so use these pins only as inputs:
GPIO 34
GPIO 39
GPIO 36 (SENSOR VP)
GPIO 38 (SENSOR VN)
GPIO 39 (SENSOR VN)

Pulsanti di BOOT e RESET.

This Buck-Boost (TPS63001DRCR) is an efficient converter (up to 96%),
and can convert either the 5V coming from the USB,
or eventually the 3-3.6V coming from the batteries,
to fixed 3.3V necessary for the esp32.
